

PhonicAccess is a strong authentication solution created to prevent brute force attacks, Trojans or sniffers hacking web sites. This high level of security allows us to propose PhonicAccess as an authentication solution for the industry of banking or cyber security.

MULTIFACTOR TECHNOLOGY

HOW DOES IT WORK?

3 STEPS

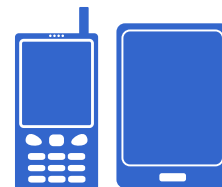

The strong authentication is achieved by adding two levels of authentication: pin code and phone number.

WHY USING PHONICACCESS?

3 REASONS

1 UNIVERSAL

To achieve sonic authentication, PhonicAccess is using the devices' speakers and microphones. Therefore, PhonicAccess is a real **universal solution**: it is working not only on smartphones but also with **all feature phones**. The user just needs to be able to receive a phone call.

2 SECURE

Multi-factor authentication and onetime passwords turn the PhonicAccess solution into a **highly secured** authentication method. Besides that, it introduces an **airgap** which increases the protection against hackers.

3 EASY DEPLOYMENT

The PhonicAccess solution can **easily** be **integrated** as a module into any existing system, application or environment thanks to the CopSonic SDK.
